The plastic fan on the motor for my ~10 year old Craftsman air compressor shattered into over a dozen pieces. I received the replacement fan and was initilly concerned that the mounting hole is not in the center of the molded plastic fan. Looking online, it seems that this proper and not a manufacturing defect. Is that correct? Also, since I have the protective shroud off the motor, I'm wondering what preventive maintenance I can do on it. Is there anything to lube or inspect? To avoid these ads, REGISTER NOW! WTF? I can't understand why the mounting hole would be off center like that unless maybe it bolts onto an adapter or something. But still, why would they do that? Is the old one like that or is it completely in pieces? What's the outside diameter of the fan? Well, I discovered my problem. I'm an idiot! I ordered the fan a week later. The fan mounts on the end of the piston rod and moves in a circular motion with the rod--hence the offcentered fan mount is necessary. This also makes sense because the back side of the fan has extra material to support this offcentered mount. 5-3/4" fan diameter: Now onto my other question. Does anyone know If I should lube the piston? Any lube suggestions? I'm comfortable with small engine repairs. I've done P&C replacements on small engines (chainsaws, lawnmowers, etc.). I've read you can completely renew the oil-less compressors by replacing the piston ring on them (cheap). Not sure if that is true or not. That is a good question.
